

Standard finishing colors

When it comes to the final finishing of Inea luminaires a epoxy powder coating technology is used for esthetical reasons as well as for protection against corrosion. For standard topcoats Inea has included colors white, black, gray, rusty iron and anthracite gray. The surface can be smooth shiny, smooth matte or fine structure, which is mostly used on architectural luminaires.

Additional options

On request Inea can offer final finishing in almost all RAL colors, and in different types of surfaces such as smooth-shiny, smooth-matte or fine structure.

Double layer coating

In addition to a standard powder coating we also offer a double layer coating for high resistance against corrosion. This type of powder coating is great for products that are exposed to outdoor conditions or products that are on buildings near the sea.
